
External CAN FD Controller with SPI Interface

Features

General

- External CAN FD Controller with Serial Peripheral Interface (SPI)
- Arbitration Bit Rate up to 1 Mbps
- Data Bit Rate up to 8 Mbps
- CAN FD Controller modes
 - Mixed CAN 2.0B and CAN FD Mode
 - CAN 2.0B Mode
- Conforms to ISO 11898-1:2015

Message FIFOs

- 31 FIFOs, configurable as Transmit or Receive FIFOs
- **One Transmit Queue (TXQ)**
- **Transmit Event FIFO (TEF) with 32 bit time stamp**

Message Transmission

- Message transmission prioritization:
 - Based on priority bit field
 - Message with lowest ID gets transmitted first using the Transmit Queue (TXQ)
- Programmable automatic retransmission attempts: unlimited, 3 attempts or disabled

Message Reception

- 32 Flexible Filter and Mask Objects
- Each object can be configured to filter either:
 - Standard ID + first 18 data bits, or
 - Extended ID
- 32-bit Time Stamp

Special Features

- VDD: 2.7 to 5.5V
- Active Current: maximum 20 mA at 5.5 V, 40 MHz CAN clock
- Sleep Current: 15 μ A, typical
- Low Power Mode current: maximum 10 μ A from -40°C to +150°C
- Message Objects are located in RAM: 2 KB
- Up to 3 Configurable Interrupt Pins
- Bus Health Diagnostics and Error Counters
- Transceiver Standby Control
- Start of frame pin for indicating the beginning of messages on the bus
- AEC-Q100 Qualified

- Temperature Ranges:
 - Extended (E): -40°C to +125°C
 - High (H): -40°C to +150°C

Oscillator Options

- 40, 20 or 4 MHz Crystal or Ceramic Resonator; External Clock Input
- Clock Output with Prescaler

SPI Interface

- Up to 20 MHz SPI clock speed
- Supports SPI Modes 0, 0 and 1, 1
- Registers and bit fields are arranged in a way to enable efficient access through SPI

Safety Critical Systems

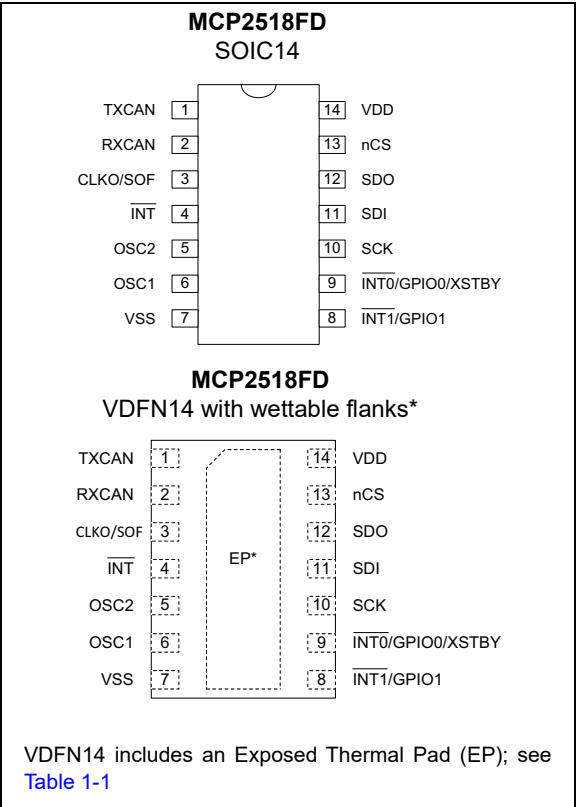

- SPI commands with CRC to detect noise on SPI interface
- Error Correction Code (ECC) protected RAM

Additional Features

- GPIO pins: $\overline{\text{INT0}}$ and $\overline{\text{INT1}}$ can be configured as general purpose I/O
- Open drain outputs: TXCAN, $\overline{\text{INT}}$, $\overline{\text{INT0}}$, and $\overline{\text{INT1}}$ pins can be configured as push/pull or open drain outputs
- ISO 26262 Functional Safety ready

MCP2518FD

Package Types

1.0 DEVICE OVERVIEW

The MCP2518FD device is a cost-effective and small-footprint CAN FD controller that can be easily added to a microcontroller with an available SPI interface. A CAN FD channel can be easily added to a microcontroller that is either lacking a CAN FD peripheral or does not have enough CAN FD channels.

MCP2518FD supports both CAN frames in the Classical format (CAN2.0B) and CAN Flexible Data Rate (CAN FD) format, as specified in ISO 11898-1:2015.

The MCP2518FD device was improved as follows:

- Added Low Power Mode (LPM), in order to reduce leakage current to 10 μ A over the full temperature range.
- **Extended SEQ field in Transmit Message Object and Transmit Event FIFO Object from 7 to 23 bits.**
- Added DEVID register to distinguish between future members of the device family.
- Switched to saw cut DFN package with wettable flanks.

1.1 Block Diagram

Figure 1.1 shows the block diagram of the MCP2518FD device. MCP2518FD contains the following main blocks:

- The CAN FD Controller module implements the CAN FD protocol, and contains the FIFOs and Filters.
- The SPI interface is used to control the device by accessing Special Function Registers (SFR) and RAM.
- The RAM controller arbitrates the RAM accesses between the SPI and CAN FD Controller module.
- The Message RAM is used to store the data of the Message Objects.
- The oscillator generates the CAN clock.
- The Internal LDO and POR circuit.
- The I/O control.

Note 1: This data sheet summarizes the features of the MCP2518FD device. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “MCP25xxFD Family Reference Manual”.

MCP2518FD

1.2 Pinout Description

Table 1-1 describes the functions of the pins.

TABLE 1-1: MCP2518FD STANDARD PINOUT VERSION

| Pin Name | SOIC | VDFN | Pin Type | Description |
|----------------------|------|------|----------|--|
| TXCAN | 1 | 1 | O | Transmit output to CAN FD transceiver |
| RXCAN | 2 | 2 | I | Receive input from CAN FD transceiver |
| CLKO/SOF | 3 | 3 | O | Clock output/Start of Frame output |
| INT | 4 | 4 | O | Interrupt output (active low) |
| OSC2 | 5 | 5 | O | External oscillator output |
| OSC1 | 6 | 6 | I | External oscillator input |
| Vss | 7 | 7 | P | Ground |
| INT1/GPIO1 | 8 | 8 | I/O | RX Interrupt output (active low)/GPIO |
| INT0/GPIO0/ XSTBY | 9 | 9 | I/O | TX Interrupt output (active low)/GPIO/ Transceiver Standby output |
| SCK | 10 | 10 | I | SPI clock input |
| SDI | 11 | 11 | I | SPI data input |
| SDO | 12 | 12 | O | SPI data output |
| nCS | 13 | 13 | I | SPI chip select input |
| VDD | 14 | 14 | P | Positive Supply |
| EP | - | 15 | P | Exposed Pad; connect to Vss |

Legend: P = Power, I = Input, O = Output

2.0 CAN FD CONTROLLER MODULE

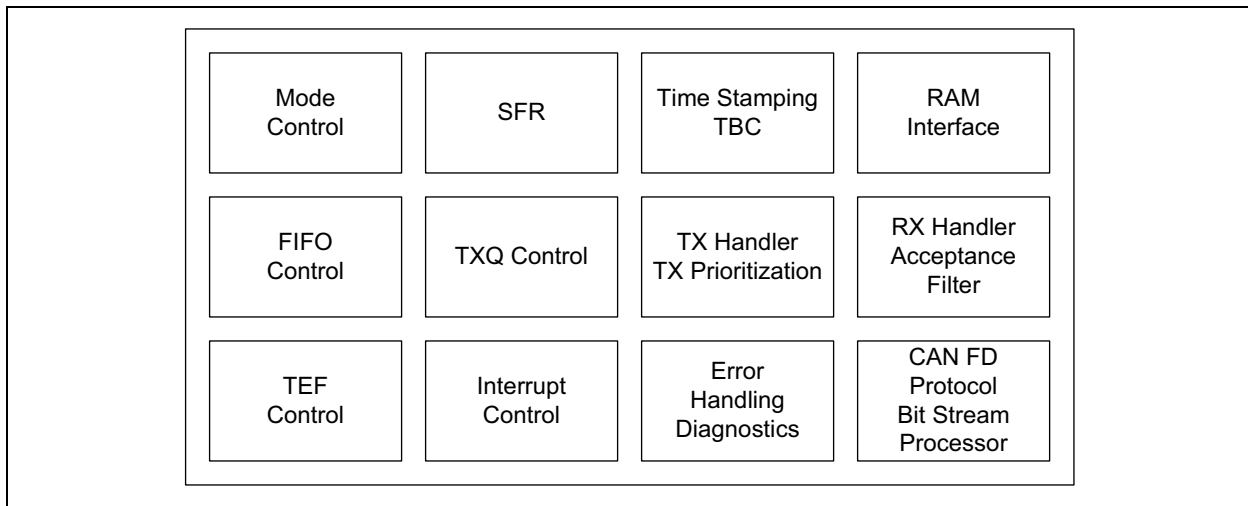

Figure 2-1 shows the main blocks of the CAN FD Controller module:

- The CAN FD Controller module has multiple modes:
 - Configuration
 - Normal CAN FD
 - Normal CAN 2.0
 - Sleep (normal Sleep mode and Low Power Mode)
 - Listen Only
 - Restricted Operation
 - Internal and External Loop back modes
- The CAN FD Bit Stream Processor (BSP) implements the Medium Access Control of the CAN FD protocol described in ISO 11898-1:2015. It serializes and de-serializes the bit stream, encodes and decodes the CAN FD frames, manages the medium access, acknowledges frames and detects and signals errors.
- The TX Handler prioritizes the messages that are requested for transmission by the Transmit FIFOs. It uses the RAM Interface to fetch the transmit data from RAM and provides it to the BSP for transmission.
- The BSP provides received messages to the RX Handler. The RX Handler uses the Acceptance Filter to filter out messages that shall be stored into Receive FIFOs. It uses the RAM Interface to store received data into RAM.

- Each FIFO can be configured either as a Transmit or Receive FIFO. The FIFO Control keeps track of the FIFO Head and Tail, and calculates the User Address. For a TX FIFO, the User Address points to the address in RAM where the data for the next transmit message shall be stored. For a RX FIFO, the User Address points to the address in RAM where the data of the next receive message shall be read. The User notifies the FIFO that a message was written to or read from RAM by incrementing the Head/Tail of the FIFO.
- The Transmit Queue (TXQ) is a special transmit FIFO that transmits the messages based on the ID of the messages stored in the queue.
- The Transmit Event FIFO (TEF) stores the message IDs of the transmitted messages.
- A free-running Time Base Counter is used to time stamp received messages. Messages in the TEF can also be time stamped.
- The CAN FD Controller module generates interrupts when new messages are received or when messages were transmitted successfully.
- The SFR are used to control and to read the status of the CAN FD Controller module.

Note 1: This data sheet summarizes the features of the CAN FD Controller module. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the "MCP25xxFD Family Reference Manual".

FIGURE 2-1: CAN FD CONTROLLER MODULE BLOCK DIAGRAM

3.0 MEMORY ORGANIZATION

Figure 3-1 illustrates the main sections of the memory and its address ranges:

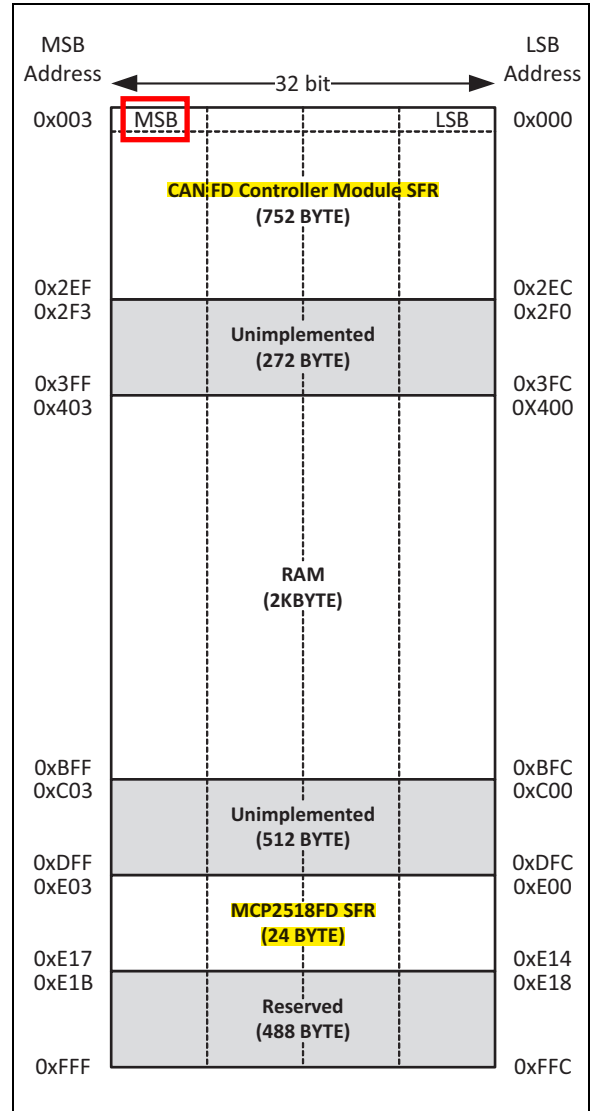

- MCP2518FD Special Function Registers
- CAN FD Controller module SFR
- Message Memory (RAM)

The SFR are 32-bit wide. The LSB is located at the lower address, for example, the LSB of C1CON is located at address 0x000, while its MSB is located at address 0x003.

Table 3-1 lists the MCP2518FD specific registers. The first column contains the address of the SFR.

Table 3-2 lists the registers of the CAN FD Controller module. The first column contains the address of the SFR.

TABLE 3-3: REGISTER LEGEND

| Symbol | Description | Symbol | Description |
|--------|--------------------------------|--------|--------------------------|
| R | Readable bit | HC | Cleared by Hardware only |
| W | Writable bit | HS | Set by Hardware only |
| U | Unimplemented bit, read as '0' | 1 | Bit is set at Reset |
| S | Settable bit | 0 | Bit is cleared at Reset |
| C | Clearable bit | × | Bit is unknown at Reset |

EXAMPLE 3-1:

R/W - 0 indicates the bit is both readable and writable, and reads '0' after a Reset.

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

- bit 31-13 **Unimplemented:** Read as '0'
- bit 12 **SCLKRDY:** Synchronized SCLKDIV bit
 - 1 = SCLKDIV 1
 - 0 = SCLKDIV 0
- bit 11 **Unimplemented:** Read as '0'
- bit 10 **OSCRDY:** Clock Ready
 - 1 = Clock is running and stable
 - 0 = Clock not ready or off
- bit 9 **Unimplemented:** Read as '0'
- bit 8 **PLLRDY:** PLL Ready
 - 1 = PLL Locked
 - 0 = PLL not ready
- bit 7 **Unimplemented:** Read as '0'
- bit 6-5 **CLKODIV[1:0]:** Clock Output Divisor
 - 11 =CLKO is divided by 10
 - 10 =CLKO is divided by 4
 - 01 =CLKO is divided by 2
 - 00 =CLKO is divided by 1
- bit 4 **SCLKDIV:** System Clock Divisor⁽¹⁾
 - 1 = SCLK is divided by 2
 - 0 = SCLK is divided by 1

Note 1: This bit can only be modified in Configuration mode.

2: Clearing OSCDIS while in Sleep mode will wake-up the device and put it back in Configuration mode.

3: Setting LPMEN does not actually put the device in LPM. It selects which Sleep mode will be entered after requesting Sleep mode using CiCON.REQOP. In order to wake up on RXCAN activity, CiINT.WAKIE must be set.

REGISTER 3-1: OSC – MCP2518FD OSCILLATOR CONTROL REGISTER (CONTINUED)

| | |
|-------|---|
| bit 3 | LPMEN: Low Power Mode (LPM) Enable ⁽³⁾ LPM会丢数据！ 1 = When in LPM, the device will stop the clock and power down the majority of the chip. Register and RAM values will be lost. The device will wake-up due to asserting nCS, or due to RXCAN activity. 0 = When in Sleep mode, the device will stop the clock, and retain it's register and RAM values. It will wake-up due to clearing the OSCDIS bit, or due to RXCAN activity. LPM 的概念在这里是更省电，所以停了时钟和ram供电 |
| bit 2 | OSCDIS: Clock (Oscillator) Disable ⁽²⁾ 1 = Clock disabled, the device is in Sleep mode. LPM 会因为CS被拉低而退出，这样也合理，去配置OSCDIS 0 = Enable Clock 另外和SLEEP共享 RXCAN的活动唤醒。 |
| bit 1 | Unimplemented: Read as '0' |
| bit 0 | PLLEN: PLL Enable ⁽¹⁾ 1 = System Clock from 10x PLL 0 = System Clock comes directly from XTAL oscillator |

- Note 1:** This bit can only be modified in Configuration mode.
- 2:** Clearing OSCDIS while in Sleep mode will wake-up the device and put it back in Configuration mode.
- 3:** Setting LPMEN does not actually put the device in LPM. It selects which Sleep mode will be entered after requesting Sleep mode using CiCON.REQOP. In order to wake up on RXCAN activity, CiINT.WAKIE must be set.

NOTES:

3.2 CAN FD Controller Module Registers

Configuration Registers

- Register 3-7: CiCON
- Register 3-8: CiNBTCFG
- Register 3-9: CiDBTCFG
- Register 3-10: CiTDC
- Register 3-11: CiTBC
- Register 3-12: CiTSCON

Interrupt and Status Registers

- Register 3-13: CIVEC
- Register 3-14: CiINT
- Register 3-15: CiRXIF
- Register 3-16: CiRXOVIF
- Register 3-17: CiTXIF
- Register 3-18: CiTXATIF
- Register 3-19: CiTXREQ

Error and Diagnostic Registers

- Register 3-20: CiTREC
- Register 3-21: CiBDIAG0
- Register 3-22: CiBDIAG1

Fifo Control and Status Registers

- Register 3-23: CiTEFCON
- Register 3-24: CiTEFSTA
- Register 3-25: CiTEFUA
- Register 3-26: CiTXQCON
- Register 3-27: CiTXQSTA
- Register 3-28: CiTXQUA
- Register 3-29: CiFIFOCONm – m = 1 to 31
- Register 3-30: CiFIFOSTAm – m = 1 to 31
- Register 3-31: CiFIFOUAm – m = 1 to 31

Filter Configuration and Control Registers

- Register 3-32: CiFLTCONm – m = 0 to 7
- Register 3-33: CiFLTOBJm – m = 0 to 31
- Register 3-34: CiMASKm – m = 0 to 31

Note: The 'i' shown in the register identifier denotes CANi, for example, C1CON. The MCP2518FD device contains one CAN FD Controller Module.

TABLE 3-4: REGISTER LEGEND

| Sym | Description | Sym | Description |
|-----|--------------------------------|-----|--------------------------|
| R | Readable bit | HC | Cleared by Hardware only |
| W | Writable bit | HS | Set by Hardware only |
| U | Unimplemented bit, read as '0' | 1 | Bit is set at Reset |
| S | Settable bit | 0 | Bit is cleared at Reset |
| C | Clearable bit | × | Bit is unknown at Reset |

EXAMPLE 3-2:

R/W - 0 indicates the bit is both readable and writable, and reads '0' after a Reset.

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-28

TXBWS[3:0]: Transmit Bandwidth Sharing bits

Delay between two consecutive transmissions (in arbitration bit times)

0000 = No delay

0001 = 2

0010 = 4

0011 = 8

0100 = 16

0101 = 32

0110 = 64

0111 = 128

1000 = 256

1001 = 512

1010 = 1024

1011 = 2048

1111-1100 = 4096

bit 27

ABAT: Abort All Pending Transmissions bit

1 = Signal all transmit FIFOs to abort transmission

0 = Module will clear this bit when all transmissions were aborted

Note 1: These bits can only be modified in Configuration mode.

2: In Sleep mode, the OPMOD bits indicate Configuration mode (OPMOD = 100) and OSC. OSCDIS will read as '1'. The application software should use these bit fields as a handshake indication for the Sleep mode request.

REGISTER 3-7: CICON – CAN CONTROL REGISTER (CONTINUED)

| | |
|-----------|--|
| bit 26-24 | REQOP[2:0]: Request Operation Mode bits 000 = Set Normal CAN FD mode; supports mixing of CAN FD and Classic CAN 2.0 frames 001 = Set Sleep mode 010 = Set Internal Loopback mode 011 = Set Listen Only mode 100 = Set Configuration mode 101 = Set External Loopback mode 110 = Set Normal CAN 2.0 mode; possible error frames on CAN FD frames 111 = Set Restricted Operation mode |
| bit 23-21 | OPMOD[2:0]: Operation Mode Status bits ⁽²⁾ 000 = Module is in Normal CAN FD mode; supports mixing of CAN FD and Classic CAN 2.0 frames 001 = Module is in Sleep mode 010 = Module is in Internal Loopback mode 011 = Module is in Listen Only mode 100 = Module is in Configuration mode 101 = Module is in External Loopback mode 110 = Module is Normal CAN 2.0 mode; possible error frames on CAN FD frames 111 = Module is Restricted Operation mode |
| bit 20 | TXQEN: Enable Transmit Queue bit ⁽¹⁾ 1 = Enables TXQ and reserves space in RAM 0 = Do not reserve space in RAM for TXQ |
| bit 19 | STEF: Store in Transmit Event FIFO bit ⁽¹⁾ 1 = Saves transmitted messages in TEF and reserves space in RAM 0 = Do not save transmitted messages in TEF |
| bit 18 | SERR2LOM: Transition to Listen Only Mode on System Error bit ⁽¹⁾ 1 = Transition to Listen Only Mode 0 = Transition to Restricted Operation Mode |
| bit 17 | ESIGM: Transmit ESI in Gateway Mode bit ⁽¹⁾ 1 = ESI is transmitted recessive when ESI of message is high or CAN controller error passive 0 = ESI reflects error status of CAN controller |
| bit 16 | RTXAT: Restrict Retransmission Attempts bit ⁽¹⁾ 1 = Restricted retransmission attempts, CiFIFOCONm.TXAT is used 0 = Unlimited number of retransmission attempts, CiFIFOCONm.TXAT will be ignored |
| bit 15-13 | Unimplemented: Read as '0' |
| bit 12 | BRSDIS: Bit Rate Switching Disable bit 1 = Bit Rate Switching is Disabled, regardless of BRS in the Transmit Message Object 0 = Bit Rate Switching depends on BRS in the Transmit Message Object |
| bit 11 | BUSY: CAN Module is Busy bit 1 = The CAN module is transmitting or receiving a message 0 = The CAN module is inactive |
| bit 10-9 | WFT[1:0]: Selectable Wake-up Filter Time bits 00 = T00FILTER 01 = T01FILTER 10 = T10FILTER 11 = T11FILTER Note: Please refer to Table 7-5 . |
| bit 8 | WAKFIL: Enable CAN Bus Line Wake-up Filter bit ⁽¹⁾ 1 = Use CAN bus line filter for wake-up 0 = CAN bus line filter is not used for wake-up |

Note 1: These bits can only be modified in Configuration mode.

2: In Sleep mode, the OPMOD bits indicate Configuration mode (OPMOD = 100) and OSC. OSCDIS will read as '1'. The application software should use these bit fields as a handshake indication for the Sleep mode request.

MCP2518FD

REGISTER 3-7: CiCON – CAN CONTROL REGISTER (CONTINUED)

| | |
|---------|---|
| bit 7 | Unimplemented: Read as '0' |
| bit 6 | PXEDIS: Protocol Exception Event Detection Disabled bit ⁽¹⁾ A recessive "res bit" following a recessive FDF bit is called a Protocol Exception. 1 = Protocol Exception is treated as a Form Error. 0 = If a Protocol Exception is detected, the CAN FD Controller Module will enter Bus Integrating state. |
| bit 5 | ISOCRCEN: Enable ISO CRC in CAN FD Frames bit ⁽¹⁾ 1 = Include Stuff Bit Count in CRC Field and use Non-Zero CRC Initialization Vector according to ISO 11898-1:2015 0 = Do NOT include Stuff Bit Count in CRC Field and use CRC Initialization Vector with all zeros |
| bit 4-0 | DNCNT[4:0]: Device Net Filter Bit Number bits 10011-11111 = Invalid Selection (compare up to 18-bits of data with EID) 10010 = Compare up to data byte 2 bit 6 with EID17 ... 00001 = Compare up to data byte 0 bit 7 with EID0 00000 = Do not compare data bytes |

Note 1: These bits can only be modified in Configuration mode.

2: In Sleep mode, the OPMOD bits indicate Configuration mode (OPMOD = 100) and OSC. OSCDIS will read as '1'. The application software should use these bit fields as a handshake indication for the Sleep mode request.

- bit 31-1 **TXREQ[31:1]:** Message Send Request bits
TXEN= 1 (Object configured as a Transmit Object)
 Setting this bit to '1' requests sending a message.
 The bit will automatically clear when the message(s) queued in the object is (are) successfully sent.
This bit can NOT be used for aborting a transmission.
TXEN= 0 (Object configured as a Receive Object)
 This bit has no effect
- bit 0 **TXREQ[0]:** Transmit Queue Message Send Request bit
 Setting this bit to '1' requests sending a message.
 The bit will automatically clear when the message(s) queued in the object is (are) successfully sent.
This bit can NOT be used for aborting a transmission.

MCP2518FD

NOTES:

3.3 Message Memory

The MCP2518FD device contains a 2 KB RAM that is used to store message objects. There are three different kinds of message objects:

- [Table 3-5](#): Transmit Message Objects used by the TXQ and by TX FIFOs.
- [Table 3-6](#): Receive Message Objects used by RX FIFOs.
- [Table 3-7](#): TEF objects.

[Figure 3-2](#) illustrates how message objects are mapped into RAM. The number of message objects for the TEF, the TXQ, and for each FIFO is configurable. Only the message objects for FIFO2 are shown in detail. The number of data bytes per message object (payload) is individually configurable for the TXQ and each FIFO.

FIFOs and message objects can only be configured in Configuration mode.

The TEF objects are allocated first. Space in RAM will only be reserved if `CiCON.STEF = 1`.

Next the TXQ objects are allocated. Space in RAM will only be reserved if `CiCON.TXQEN = 1`.

Next the message objects for FIFO1 through FIFO31 are allocated.

This highly flexible configuration results in an efficient usage of the RAM.

The addresses of the message objects depend on the selected configuration. The application does not have to calculate the addresses. The User Address field provides the address of the next message object to read from or write to.

3.3.1 RAM ECC

The RAM is protected with an Error Correction Code (ECC). The ECC logic supports Single Error Detection (SEC) and Double Error Detection (DED).

SEC/DED requires seven parity bits in addition to the 32 data bits.

[Figure 3-3](#) shows the block diagram of the ECC logic.

3.3.1.1 ECC Enable and Disable

The ECC logic can be enabled by setting `ECCCON.ECCEN`. When ECC is enabled, the data written to the RAM is encoded, and the data read from RAM is decoded.

When the ECC logic is disabled, the data is written to RAM, the parity bits are taken from `ECCCON.PARITY`. This enables the testing of the ECC logic by the user. During a read the parity bits are stripped out and the data is read back unchanged.

3.3.1.2 RAM Write

During a RAM write, the Encoder calculates the parity bits and adds the parity bits to the input data.

3.3.1.3 RAM READ

During a RAM read, the Decoder checks the output data from RAM for consistency and removes the parity bits. It corrects single bit errors and detects double bit errors.

4.0 SPI INTERFACE

The MCP2518FD device is designed to interface directly with a Serial Peripheral Interface port available on most microcontrollers. The SPI in the microcontroller must be configured in mode 0, 0 or 1, 1 in 8-bit operating mode.

SFR and Message Memory (RAM) are accessed using SPI instructions. Figure 4-1 illustrates the generic format of the SPI instructions (SPI mode 0, 0). Each instruction starts with driving nCS low (falling edge on nCS). The 4-bit command and the 12-bit address are shifted into SDI on the rising edge of SCK. During a write instruction, data bits are shifted into SDI on the rising edge of SCK. During a read instruction, data bits are shifted out of SDO on the falling edge of SCK. One or more data bytes are transferred with one instruction. Data bits are updated on the falling edge of SCK and must be valid on the rising edge of SCK. Each instruction ends with driving nCS high (rising

edge on nCS).

Refer to Figure 7-1 for detailed input and output timing for both mode 0, 0 and mode 1, 1.

Table 4-1 lists the SPI instructions and their format.

Note 1: The frequency of SCK has to be less than or equal to $0.85 * \text{half the frequency of SYSCLK}$. This ensures that the synchronization between SCK and SYSCLK works correctly.

2: In order to minimize the Sleep current, the SDO pin of the MCP2518FD device must not be left floating while the device is in Sleep mode. This can be achieved by enabling a pull-up or pull-down resistor inside the MCU on the pin that is connected to the SDO pin, while the MCP2518FD device is in Sleep mode.

FIGURE 4-1: SPI INSTRUCTION FORMAT

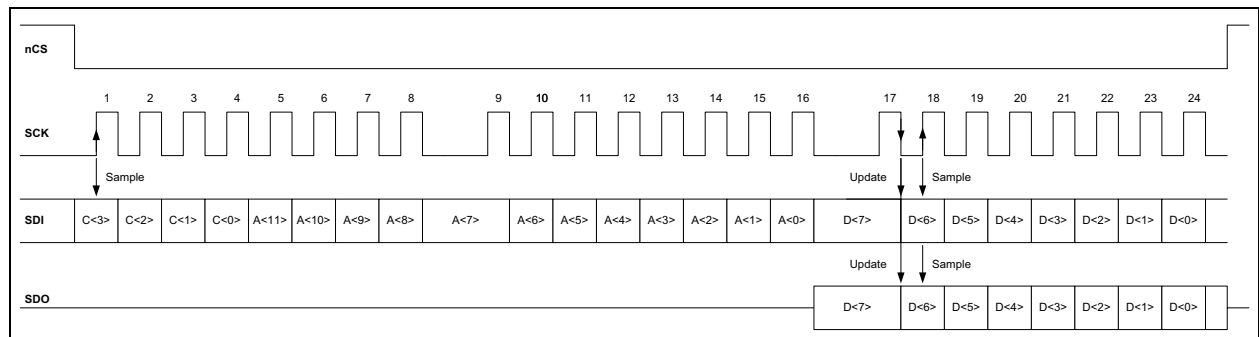

TABLE 4-1: SPI INSTRUCTIONS

| Name | Format | Description |
|------------|---|---|
| RESET | C = 0b0000; A = 0x000 | Resets internal registers to default state; selects Configuration mode. |
| READ | C = 0b0011; A; D = SDO | Read SFR/RAM from address A. |
| WRITE | C = 0b0010; A; D = SDI | Write SFR/RAM to address A. |
| READ_CRC | C = 0b1011; A; N; D = SDO; CRC = SDO | Read SFR/RAM from address A. N data bytes. Two bytes CRC. CRC is calculated on C, A, N and D. |
| WRITE_CRC | C = 0b1010; A; N; D = SDI; CRC = SDI | Write SFR/RAM to address A. N data bytes. Two bytes CRC. CRC is calculated on C, A, N and D. |
| WRITE_SAFE | C = 0b1100; A; D = SDI; CRC = SDI | Write SFR/RAM to address A. Check CRC before write. CRC is calculated on C, A and D. |

Legend: C = Command (4 bit), A = Address (12 bit), D = Data (1 to n bytes), N = Number of Bytes (1 byte), CRC (2 bytes)

4.1 SFR Access

The SFR access is byte-oriented. Any number of data bytes can be read or written with one instruction. The address is incremented by one automatically after every data byte. The address rolls over from 0xFF to 0x00.

The following SPI instructions only show the different fields and their values. Every instruction follows the generic format illustrated in Figure 4-1.

4.1.1 RESET

Figure 4-2 illustrates the RESET instruction. The instruction starts with nCS going low. The Command (C[3:0] = 0b0000) is followed by the Address (A[11:0] = 0x000). The instruction ends when nCS goes high.

The RESET instruction should only be issued after the device enters Configuration mode. All SFR and State Machines are reset just like during a Power-on Reset (POR), and the device transitions immediately to Configuration mode.

The Message Memory is not changed.

The actual reset happens at the end of the instruction when nCS goes high.

4.1.2 SFR READ – READ

Figure 4-3 illustrates the READ instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b0011), is followed by the Address (A[11:0]). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). Any number of data bytes can be read. The instruction ends when nCS goes high.

4.1.3 SFR WRITE – WRITE

Figure 4-4 illustrates the WRITE instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b0010), is followed by the Address (A[11:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Any number of data bytes can be written. The instruction ends when nCS goes high.

Note: The bit fields in the IOCON register must be written using the single data byte SFR WRITE instructions.

Data bytes are written to the register with the falling edge on SCK following the 8th data bit.

FIGURE 4-2: RESET INSTRUCTION

FIGURE 4-3: SFR READ INSTRUCTION

FIGURE 4-4: SFR WRITE INSTRUCTION

4.2 Message Memory Access

The Message Memory (RAM) access is word-oriented (4 bytes at a time). Any multiple of 4 data bytes can be read or written with one instruction. The address is incremented by one automatically after every data byte. The address rolls over from 0xBFF to 0x400.

Writes and Reads must be word-aligned. The lower two bits of the address are always assumed to be 0. It is not possible to do unaligned reads/writes.

The following SPI instructions only show the different fields and their values. Every instruction follows the generic format illustrated in Figure 4-1.

4.2.1 MESSAGE MEMORY READ – READ

Figure 4-5 illustrates the READ instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b0011), is followed by the Address (A[11:0]). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). The instruction ends when nCS goes high.

Read commands from RAM must always read a multiple of 4 data bytes. A word is internally read from RAM after the address field, and after every fourth data byte read on the SPI. In case nCS goes high before a multiple of 4 data bytes is read on SDO, the incomplete read should be discarded by the microcontroller.

4.2.2 MESSAGE MEMORY WRITE – WRITE

Figure 4-6 illustrates the WRITE instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b0010), is followed by the Address (A[11:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). The instruction ends when nCS goes high.

Write commands must always write a multiple of 4 data bytes. After every fourth data byte, with the falling edge on SCK, the RAM Word gets written. In case nCS goes high before a multiple of 4 data bytes is received on SDI, the data of the incomplete Word will not be written to RAM.

FIGURE 4-5: MESSAGE MEMORY READ INSTRUCTION

FIGURE 4-6: MESSAGE MEMORY WRITE INSTRUCTION

4.3 SPI Commands with CRC

In order to detect or avoid bit errors during SPI communication, SPI commands with CRC are available.

4.3.1 CRC CALCULATION

The CRC is calculated in parallel with the SPI shift register (see [Figure 4-7](#)).

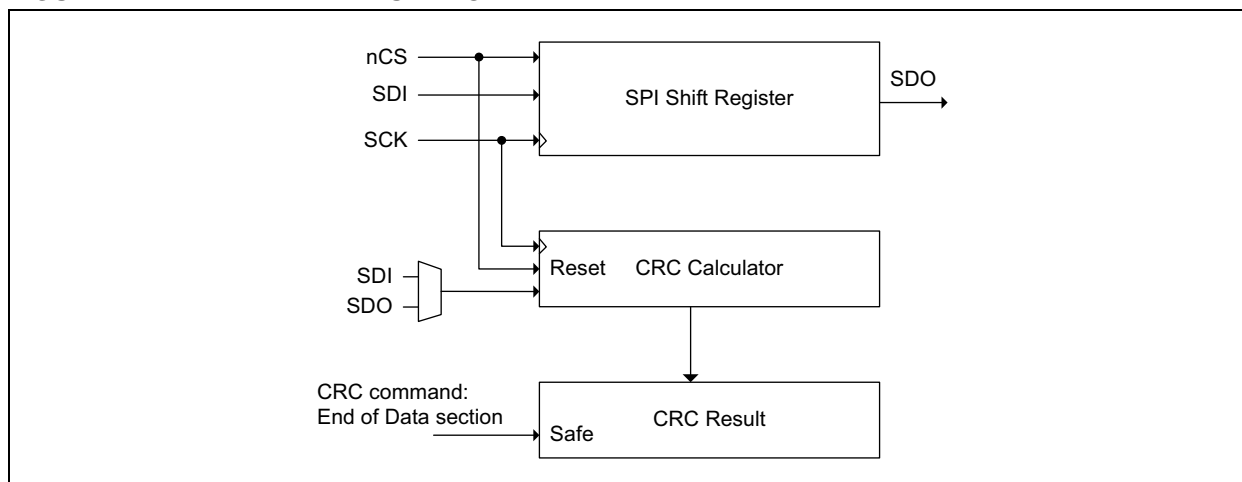

When nCS is asserted, the CRC calculator is reset to 0xFFFF.

The result of the CRC calculation is available after the Data section of a CRC command. The result of the CRC calculation is written to the CRC register in case a CRC mismatch is detected. In case of a CRC mismatch, CRC.CRCERRIF is set.

The MCP2518FD device uses the following generator polynomial: CRC-16/USB (0x8005). CRC-16 detects all single and double-bit errors, all errors with an odd number of bits, all burst errors of length 16 or less, and most errors for longer bursts. This allows an excellent detection of SPI communication errors that can happen in the system, and heavily reduces the risk of miscommunication, even under noisy environments.

The maximum number of data bits is used while reading and writing TX or RX Message Objects. A RX Message Object with 64 Bytes of data + 12 Bytes ID and Time Stamp contains 76 Bytes or 608 bits. In comparison, USB data packets contain up to 1024 bits. CRC-16 has a Hamming Distance of 4 up to 1024 bits.

FIGURE 4-7: CRC CALCULATION

4.3.2 SFR READ WITH CRC – READ_CRC

Figure 4-8 illustrates the READ_CRC instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b1011), is followed by the Address (A[11:0]), and the number of data bytes (N[7:0]). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by the data byte from address A+1 (DB[A+1]). Any number of data bytes can be read. Next the CRC is shifted out (CRC[15:0]). The instruction ends when nCS goes high.

The CRC is provided to the microcontroller. The microcontroller checks the CRC. No interrupt is generated on CRC mismatch during a READ_CRC command inside the MCP2518FD device.

If nCS goes high before the last byte of the CRC is shifted out, a CRC Form Error interrupt is generated: CRC.FERRIF.

4.3.3 SFR WRITE WITH CRC – WRITE_CRC

Figure 4-9 illustrates the WRITE_CRC instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b1010), is followed by the Address (A[11:0]), and the number of data bytes (N[7:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Any number of data bytes can be written. Next the CRC is shifted in (CRC[15:0]). The instruction ends when nCS goes high.

The SFR is written to the register after the data byte was shifted in on SDI, with the falling edge on SCK. Data bytes are written to the register before the CRC is checked.

The CRC is checked at the end of the write access. In case of a CRC mismatch, a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC Form Error interrupt is generated: CRC.FERRIF.

FIGURE 4-8: SFR READ WITH CRC INSTRUCTION

FIGURE 4-9: SFR WRITE WITH CRC INSTRUCTION

4.3.4 SFR WRITE SAFE WITH CRC – WRITE_SAFE

This instruction ensures that only correct data is written to the SFR.

Figure 4-10 illustrates the WRITE_SAFE instruction, while accessing SFR. The instruction starts with nCS going low. The Command (C[3:0] = 0b1100), is followed by the Address (A[11:0]). Afterwards, one data byte is shifted into address A (DB[A]). Next the CRC (CRC[15:0]) is shifted in. The instruction ends when nCS goes high.

The data byte is only written to the SFR after the CRC is checked and if it matches.

If the CRC mismatches, the data byte is not written to the SFR and a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC Form Error interrupt is generated: CRC.FERRIF.

FIGURE 4-10: SFR WRITE SAFE WITH CRC INSTRUCTION

MCP2518FD

4.3.5 MESSAGE MEMORY READ WITH CRC – READ_CRC

Figure 4-11 illustrates the READ_CRC instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b1011), is followed by the Address (A[11:0]), and the number of data Words (N[7:0]). Afterwards, the data byte from address A (DB[A]) is shifted out, followed by data byte from address A+1 (DB[A+1]). Next the CRC (CRC[15:0]) is shifted out. The instruction ends when nCS goes high.

Writes and Reads must be word-aligned. The lower two bits of the address are always assumed to be 0. It is not possible to do unaligned reads/writes.

Read commands should always read a multiple of 4 data bytes. A word is internally read from RAM after the “N” field, and after every fourth data byte read on the SPI. In case nCS goes high before a multiple of 4 data bytes are read on SDO, the incomplete read should be discarded by the microcontroller.

The CRC is provided to the microcontroller. The microcontroller checks the CRC. No interrupt is generated on CRC mismatch during a READ_CRC command inside the MCP2518FD device.

If nCS goes high before the last byte of the CRC is shifted out, a CRC Form Error interrupt is generated: CRC.FERRIF.

4.3.6 MESSAGE MEMORY WRITE WITH CRC – WRITE_CRC

Figure 4-12 illustrates the WRITE instruction accessing the RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b1010), is followed by the Address (A[11:0]), and the number of data Words (N[7:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into address A+1 (DB[A+1]). Next the CRC (CRC[15:0]) is shifted in. The instruction ends when nCS goes high.

Write commands must always write a multiple of 4 data bytes. After every fourth data byte, with the falling edge on SCK, the RAM gets written. In case nCS goes high before a multiple of 4 data bytes is received on SDI, the data of the incomplete Word will not be written to RAM.

The CRC is checked at the end of the write access. In case of a CRC mismatch, a CRC interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC interrupt is generated: CRC.FERRIF.

FIGURE 4-11: MESSAGE MEMORY READ WITH CRC INSTRUCTION

| | | | | DB[A] | DB[A+1] | DB[A+2] | DB[A+3] | | | |

4.3.7 MESSAGE MEMORY WRITE SAFE WITH CRC – WRITE_SAFE

This instruction ensures that only correct data is written to RAM.

Figure 4-10 illustrates the WRITE_SAFE instruction, while accessing RAM. The instruction starts with nCS going low. The Command (C[3:0] = 0b1100), is followed by the Address (A[11:0]). Afterwards, the data byte is shifted into address A (DB[A]), next into

address A+1 (DB[A+1]), A+2 (DB[A+2]), and A+3 (DB[A+3]). Next the CRC (CRC[15:0]) is shifted in. The instruction ends when nCS goes high.

The data word is only written to RAM after the CRC is checked and if it matches.

If the CRC mismatches, the data word is not written to RAM and a CRC Error interrupt is generated: CRC.CRCERRIF.

If nCS goes high before the last byte of the CRC is shifted in, a CRC interrupt is generated: CRC.FERRIF.

FIGURE 4-13: MESSAGE MEMORY WRITE SAFE WITH CRC INSTRUCTION

5.0 OSCILLATOR

Figure 5-1 shows the block diagram of the oscillator in the MCP2518FD device. The oscillator system generates the SYSCLK, which is used in the CAN FD Controller module and for RAM accesses. It is recommended by the CAN FD community to use either a 40 or 20 MHz SYSCLK.

The time reference for clock generation can be an external 40, 20 or 4 MHz crystal, ceramic resonator or external clock.

The OSC register controls the oscillator. The PLL can be enabled to multiply the 4 MHz clock by 10.

The internal 40/20 MHz can be divided by two.

The internally generated clock can be divided and provided on the CLKO pin.

FIGURE 5-1: MCP2518FD OSCILLATOR BLOCK DIAGRAM

MCP2518FD

6.0 I/O CONFIGURATION

The IOCON register is used to configure the I/O pins:

- CLKO/SOF: select Clock Output or Start of Frame.
- TXCANOD: TXCAN can be configured as Push-Pull or as Open Drain output. Open Drain outputs allows the user to connect multiple controllers together to build a CAN network without using a transceiver.
- $\overline{\text{INT0}}$ and $\overline{\text{INT1}}$ can be configured as GPIO with similar registers as in the PIC microcontrollers or as Transmit and Receive interrupts.
- $\overline{\text{INT0}}$ /GPIO0/**XSTBY** can also be used to automatically control the standby pin of the transceiver.

- INTOD: The interrupt pins can be configured as open-drain or push/pull outputs.

6.0.1 INTERRUPT PINS

The MCP2518FD device contains three different interrupt pins, see [Figure 6-1](#):

- $\overline{\text{INT}}$ is asserted on any interrupt in the CiINT register (xIF & xIE), including the RX and TX interrupts.
- $\overline{\text{INT1}}$ /GPIO1 can be configured as GPIO or RX interrupt pin (CiINT.RXIF & RXIE).
- $\overline{\text{INT0}}$ /GPIO0 can be configured as GPIO or TX interrupt pin (CiINT.TXIF & TXIE).

All interrupt pins are active low.

FIGURE 6-1: INTERRUPT PINS

7.0 ELECTRICAL SPECIFICATIONS

7.1 Absolute Maximum Ratings†

| | |
|--|---------------------------------|
| V _{DD} | -0.3V to 6.0V |
| DC Voltage at all I/O w.r.t GND | -0.3V to V _{DD} + 0.3V |
| Virtual Junction Temperature, T _{VJ} (IEC60747-1) | -40°C to +165°C |
| Soldering temperature of leads (10 seconds) | +300°C |
| ESD protection on all pins (IEC 801; Human Body Model)..... | ±4 kV |

TABLE 7-4: CAN BIT RATE

| AC Specifications | | Electrical Characteristics: Extended (E): T _{AMB} = -40°C to +125°C; High (H): T _{AMB} = -40°C to +150°C; V _{DD} = 2.7V to 5.5V | | | | |
|-------------------|------------------|--|-----|-----|-------|---------------------|
| Sym | Characteristic | Min | Typ | Max | Units | Conditions/Comments |
| BRNOM | Nominal Bit Rate | 0.125 | 0.5 | 1 | Mbps | |
| BRDATA | Data Bit Rate | 0.5 | 2 | 8 | Mbps | BRDATA ≥ BRNOM |

Note 1: Tested bit rates. Device allows the configuration of more bit rates, including slower bit rates than the minimum stated.

TABLE 7-5: CAN RX FILTER AC CHARACTERISTICS

| AC Specifications | | Electrical Characteristics: Extended (E): T _{AMB} = -40°C to +125°C; High (H): T _{AMB} = -40°C to +150°C; V _{DD} = 2.7V to 5.5V | | | | |
|---------------------|---|--|------|--------------------------|-------|--|
| Sym. | Characteristic | Min. | Typ. | Max. | Units | Conditions/Comments |
| T _{PROP} | Filter propagation delay | — | 1 | — | ns | Note 2 |
| T _{FILTER} | Filter time | 50 80 130 225 | — | 100 140 220 390 | ns | T00FILTER T01FILTER T10FILTER T11FILTER Note 3 |
| TREVO- CERY | Minimum high time on input for output to go high again | 5 | — | — | ns | Note 2 |

Note 1: Characterized; not 100% tested.

2: Design guidance only.

3: Pulses on RXCAN shorter than the minimum T_{FILTER} time will be ignored; pulses longer than the maximum T_{FILTER} time will wake-up the device.

TABLE 7-6: SPI AC CHARACTERISTICS

| AC Specifications | | | Electrical Characteristics: Extended (E): T _{AMB} = -40°C to +125°C; High (H): T _{AMB} = -40°C to +150°C, V _{DD} = 2.7V to 5.5V | | | | |
|-------------------|----------------------|--|--|------|--------------------|-------|---------------------------|
| Param. | Sym. | Characteristic | Min. | Typ. | Max. | Units | Conditions |
| | F _{SCK} | SCK Input Frequency | — | — | 17 | MHz | Note 3 |
| | T _{SCK} | SCK Period, T _{SCK} =1/F _{SCK} | 59 | — | — | ns | Note 3 |
| 1 | T _{SCKH} | SCK High Time | 20 | — | — | ns | |
| 2 | T _{SCKL} | SCK Low Time | 20 | — | — | ns | |
| 3 | T _{SCKR} | SCK Rise Time | — | — | 100 | ns | Note 2 |
| 4 | T _{SCKF} | SCK Fall Time | — | — | 100 | ns | Note 2 |
| 5 | T _{CS2SCK} | nCS ↓ to SCK ↑ | T _{SCK} /2 | — | — | ns | |
| 6 | T _{SCK2CS} | SCK ↑ to nCS ↑ | T _{SCK} | — | — | ns | |
| 7 | T _{SDI2SCK} | SDI Setup: SDI ↓ to SCK ↑ | 5 | — | — | ns | |
| 8 | T _{SCK2SDI} | SDI Hold: SCK ↑ to SDI ↓ | 5 | — | — | ns | |
| 9 | T _{SCK2SDO} | SDO Valid: SCK ↓ to SDO ↓ | — | — | 20 | ns | C _{LOAD} = 50 pF |
| 10 | T _{CS2SDOZ} | SDO High Z: nCS ↑ to SDO Z | — | — | 2 T _{SCK} | ns | C _{LOAD} = 50 pF |
| 11 | T _{CSD} | nCS ↑ to nCS ↓ | T _{SCK} | — | — | ns | Note 2 |

Note 1: Characterized; not 100% tested.

2: Design guidance only.

3: F_{SCK} must be less than or equal to 0.85*(F_{SYSCLOCK}/2).

NOTES:

8.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (for example, outside specified power supply range) and therefore outside the warranted range.

9.0 PACKAGING INFORMATION

9.1 Package Marking Information

14-Lead SOIC

Example:

14-Lead VDFN

Example:

| | | |
|----------------|--------|--|
| Legend: | XX...X | Customer-specific information |
| | Y | Year code (last digit of calendar year) |
| | YY | Year code (last 2 digits of calendar year) |
| | WW | Week code (week of January 1 is week '01') |
| | NNN | Alphanumeric traceability code |
| | (e3) | Pb-free JEDEC® designator for Matte Tin (Sn) |
| | * | This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package. |

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

NOTES:

APPENDIX A: REVISION HISTORY

Revision B (December 2020)

- Added AEC-Q100 qualification to [Special Features](#) section.
- Updated [Table 3-1](#).
- Updated [Register 3-2](#).
- Updated [Register 3-4](#).
- Updated [Register 3-5](#).
- Updated [Register 3-7](#).
- Updated [Register 3-23](#).
- Updated [Section 3.3.1, RAM ECC](#).
- Updated [Section 4.1, SFR Access](#).
- Updated [Section 4.1.3, SFR WRITE – WRITE](#).
- Updated [Table 7-6](#).

Revision A (April 2019)

- Original release of this document

MCP2518FD

APPENDIX B: CAN FD CONFORMANCE

The MCP2518FD passed the CAN FD conformance tests specified in ISO 16845-1:2016.

ISO 11898-1:2015 lists non-mandatory features. Table B-1 clarifies which optional features are implemented.

TABLE B-1: ISO OPTIONAL FEATURES

| No. | Optional Feature | Implemented |
|-----|---|---|
| 1 | FD frame format | Yes |
| 2 | Disabling of frame formats | Yes. Classical CAN frame format. |
| 3 | Limited LLC frames | No. Full range of IDs and DLCs implemented. |
| 4 | No transmission of frames including padding bytes | N/A. See No. 3. |
| 5 | LLC Abort interface | Yes |
| 6 | ESI and BRS bit values | Yes |
| 7 | Method to provide MAC data consistency | Yes |
| 8 | Time and time triggering | Start of Frame output. |
| 9 | Time stamping | Yes. 32 bit TBC. |
| 10 | Bus monitoring mode | Yes |
| 11 | Handle | Yes |
| 12 | Restricted operation | Yes |
| 13 | Separate prescalers for nominal bits and for data bits | Yes |
| 14 | Disabling of automatic retransmission | Yes |
| 15 | Maximum number of retransmissions | Yes. One, 3 or unlimited. |
| 16 | Disabling of protocol exception event on res bit detected recessive | Yes. Selectable. |
| 17 | PCS_Status | No |
| 18 | Edge filtering during the bus integration state | Yes. Selectable. |
| 19 | Time resolution for SSP placement | Yes. 128 T _Q . Measured, manual or disabled. |
| 20 | FD_T/R message | TX and RX interrupts. |

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

| PART NO. | X ⁽¹⁾ | -X | /XX | XXX | |
|---|----------------------|-------------------|---------|---------------|--|
| Device | Tape and Reel Option | Temperature Range | Package | Qualification | |
| <div> <div> Device: MCP2518FD: CAN FD Controller </div> <div> Tape and Reel Option: T = Tape and Reel⁽¹⁾ </div> <div> Temperature Range: E = -40°C to +125°C (Extended) H = -40°C to +150°C (High) </div> <div> Package: SL = Plastic SOIC (150 mil Body), 14-Lead QBB = Plastic VDFN (4.5 x 3 mm Body), 14-Lead with 1.6 x 4.2 mm Exposed Pad and Stepped Wettable Flanks </div> <div> Qualification Blank = Standard qualification VAO = Automotive Qualification </div> </div> | | | | | |

This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option. |

MCP2518FD

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication is provided for the sole purpose of designing with and using Microchip products. Information regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL OR CONSEQUENTIAL LOSS, DAMAGE, COST OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

For information regarding Microchip's Quality Management Systems, please visit www.microchip.com/quality.
